Why VAWTs?

### General discussion

### Background

• Traditionally, HAWTs dominate the large-sized turbine market

Motivation

- Increased interest in the small and medium-sized range
- Impulse to new developments in VAWTs

### Advantages of VAWTs

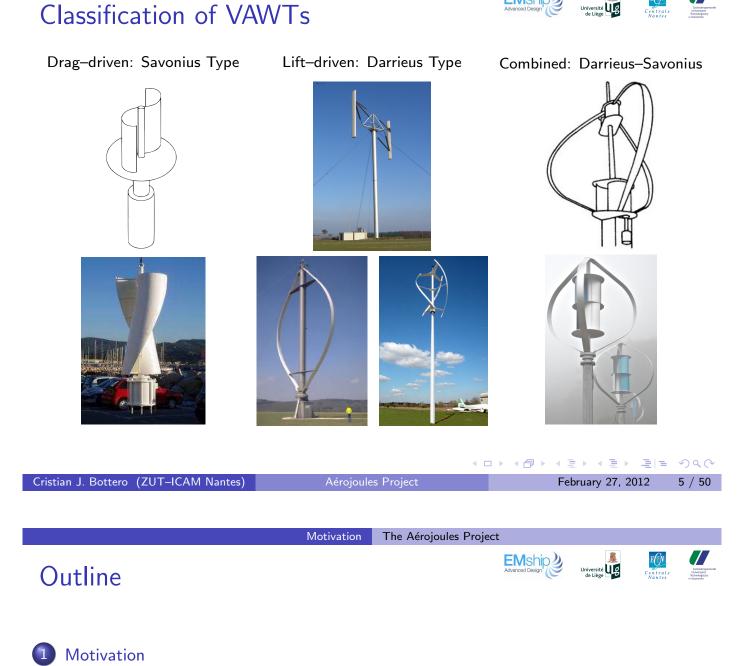

- No special mechanisms for yawing into wind
- Generator closer to ground, simpler maintenance
- Lower operational speed: Less noise in urban installation

#### Disadvantages of VAWTs

- Less efficient than horizontal axis wind turbines
- Difficulty of modeling the wind flow accurately
- Highly dynamic loading on the blade

Université de Liège

- Why VAWTs? The Aérojoules Project

### Origin and Objectives

### About the project

- Started by the Ocean Vital Foundation
- Model successfully tested at the Vendée Globe 2008

< A >

# Aimed at obtaining the global efficiency

• Actuator Disk Method  $\Rightarrow$  Maximum efficiency 59.3%

- Double Actuator Disk Method  $\Rightarrow$  Maximum efficiency 64%
- Rotor Disk Method  $\Rightarrow$  HAWT

### Aimed at obtaining the flow characteristics

- Blade-Element/Momentum Theory (BEM)  $\Rightarrow$  HAWT
- Double Multiple Streamtube Method (DMS) ⇒ Simple flow field
- Vortex Method  $\Rightarrow$  Noise propagation analysis
- **Computational Fluid Dynamics (CFD)**  $\Rightarrow$  Efficiency & flow pattern

### Performance and main dimensions

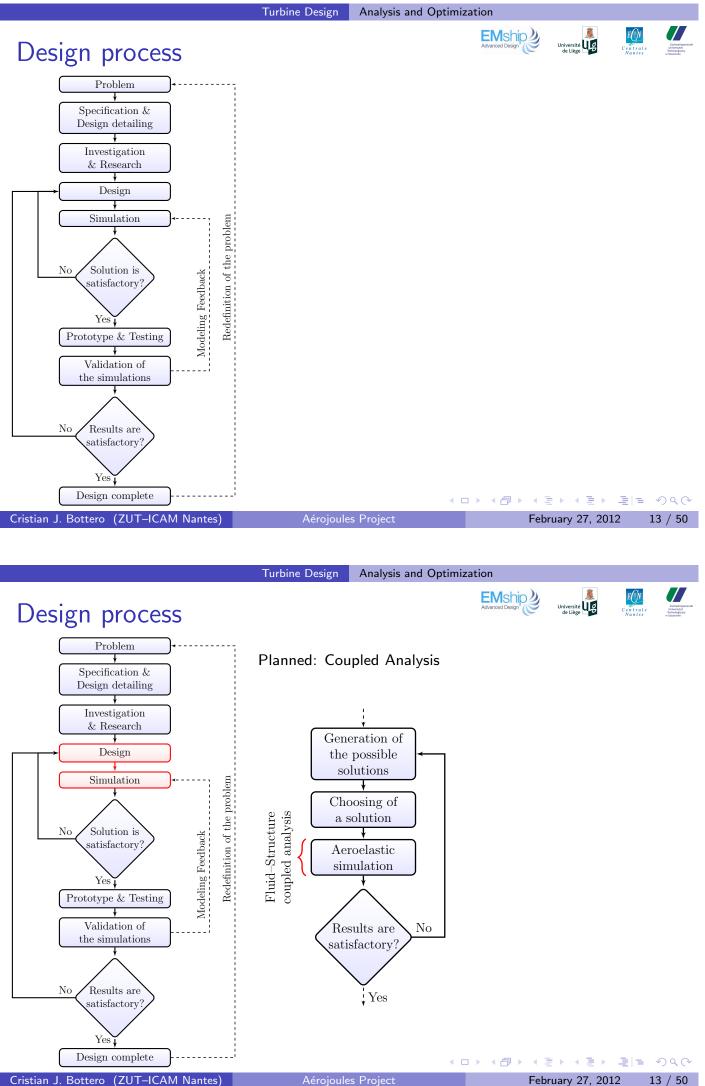

#### Considered constraints

- Expected power output
- Compromise between aerodynamic and power generation aspects
- Aesthetic aspect of the turbine
- Interaction with the future manufacturer
- Search for an airfoil with the best lift to drag ratio

#### Parameters set

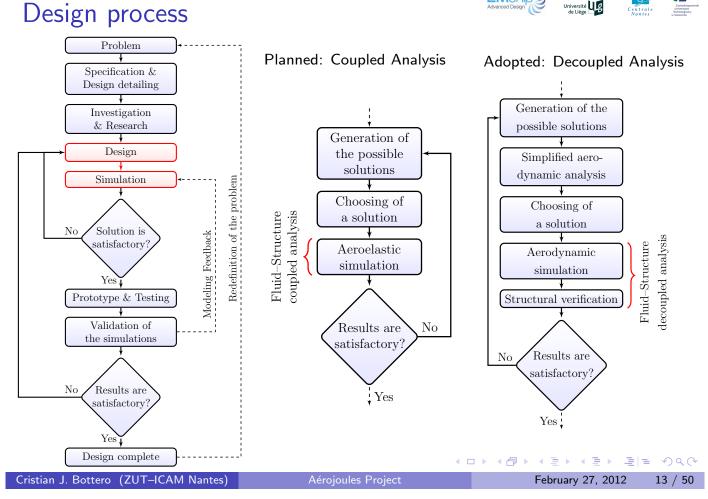

- $2m^2$  square-shape swept area: diameter = height = 1.4m
- Three helicoidal blades in composite materials: fiber glass epoxy
- NACA 6412 airfoil, chord = 0.2m

### Study of design alternatives

#### Interfaces at intermediate positions along the blades

- Concept used on a tested model
- Reduction of bending efforts at links
- Local reduction of aerodynamic forces
- Tip vortex effect not addressed

#### Interfaces at the blades extremities

- Allows works on tip vortex effect
- Increased solicitations at links
- Might require additional intermediate supports

### General discussion

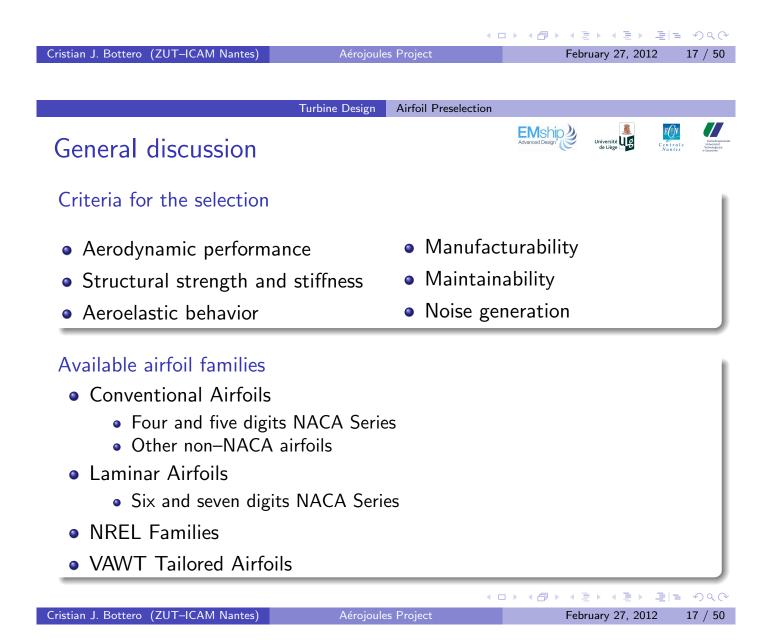

#### Criteria for the selection

- Aerodynamic performance
- Structural strength and stiffness
- Aeroelastic behavior

Manufacturability

## Models characteristics

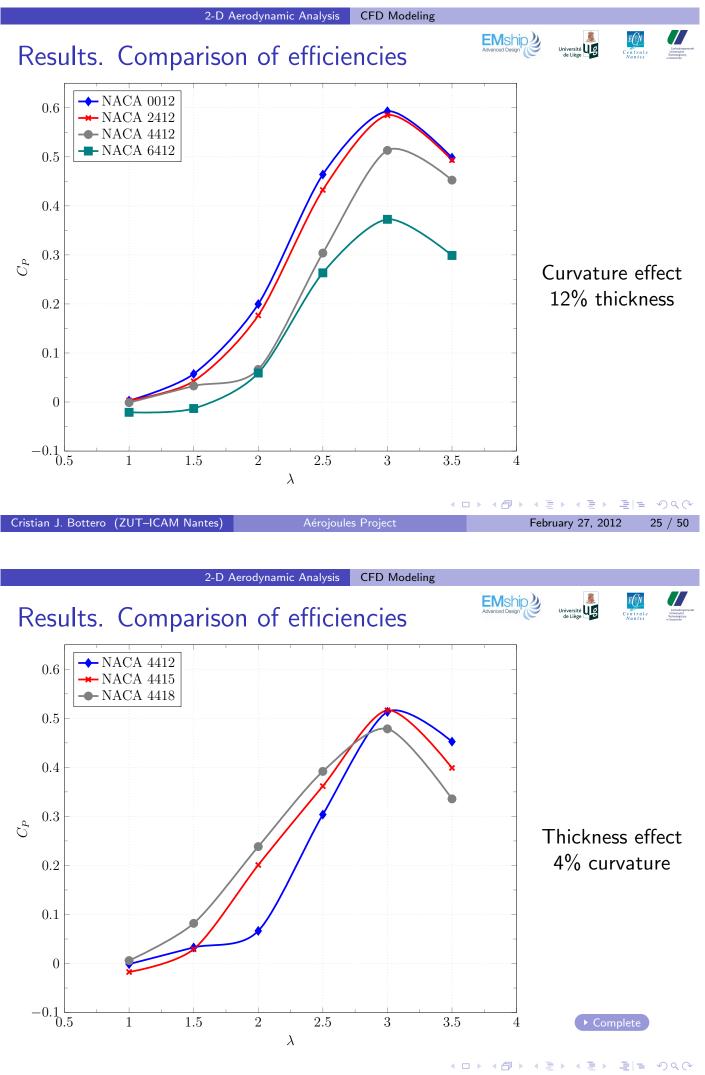

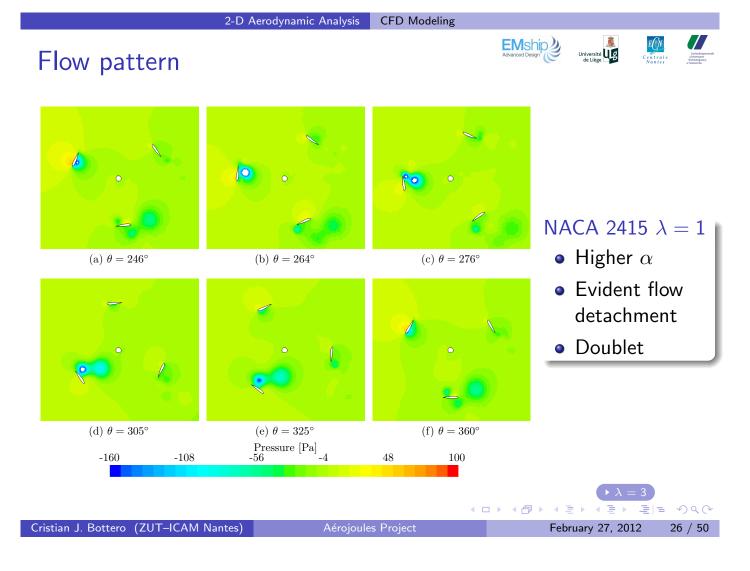

#### Considerations

- $V_{inlet} = 5m/s$
- RANS equations
- Realizable  $k-\epsilon$  model
- Two-Layer approach
- All y+ wall treatment
- Six values of  $\lambda$

▶ Mesh

2-D Aerodynamic Analysis CFD Modeling

## Conclusion of the analysis

#### Effect of curvature increase

- Reduction of peak efficiency
- Self-starting characteristics not captured

### Conclusion of the analysis

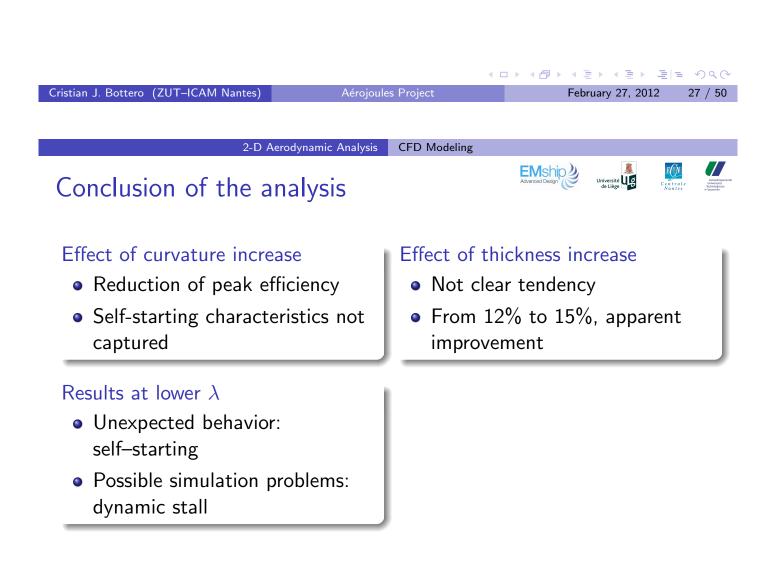

#### Effect of curvature increase

- Reduction of peak efficiency
- Self-starting characteristics not captured

#### Effect of thickness increase

- Not clear tendency
- From 12% to 15%, apparent improvement

EMship少

### Conclusion of the analysis

### Effect of curvature increase

- Reduction of peak efficiency
- Self-starting characteristics not captured

#### Results at lower $\lambda$

- Unexpected behavior: self-starting
- Possible simulation problems: dynamic stall

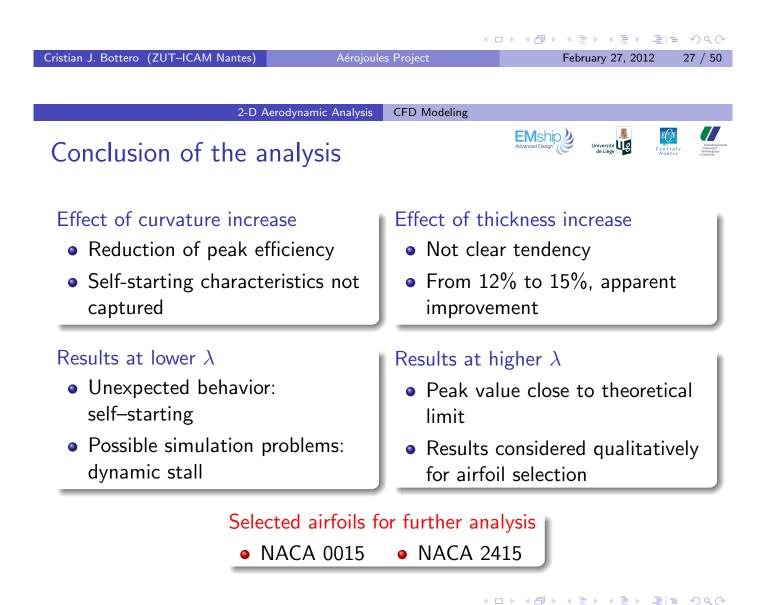

#### Effect of thickness increase

- Not clear tendency
- From 12% to 15%, apparent improvement

EMship少

#### Results at higher $\lambda$

- Peak value close to theoretical limit
- Results considered qualitatively for airfoil selection

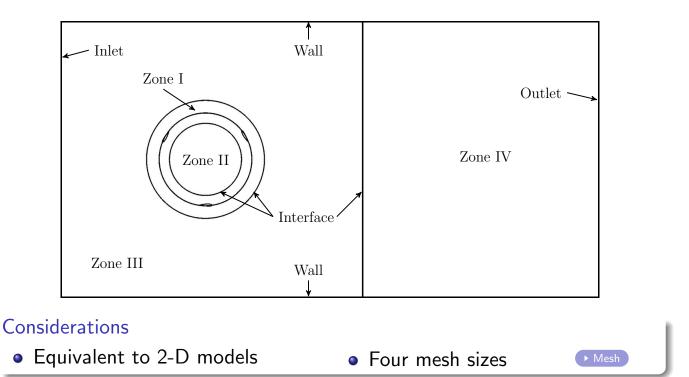

EMship

## Limitations and future work

### Inconveniences detected and proposed solutions

- CFD models with unsatisfactory results
  - Improvement of mesh quality
  - Assessment of the effect of turbulence model and grid-sensitivity
  - Simplification of the domain under study
  - Efficiency analysis based on alternative methods
- Incomplete structural analysis
  - Proceed with detailed analysis of the material layup

Cristian J. Bottero	(ZUT-ICAM Nantes)	

Conclusions and Recommendations Limitations and Future Work

Aérojoules Project

### Inconveniences detected and proposed solutions

- CFD models with unsatisfactory results
  - Improvement of mesh quality
  - Assessment of the effect of turbulence model and grid-sensitivity
  - Simplification of the domain under study
  - Efficiency analysis based on alternative methods
- Incomplete structural analysis
  - Proceed with detailed analysis of the material layup

#### Recommended tasks

- Wind tunnel testing
  - Proceed with model validation and feedback
- Material testing
  - Characterization of unidirectional specimens to improve structural design
- Preliminary pressure loads estimation
  - Continue with the validation and development of the methodology
